Re: Sanitary Sewer Overflow Annual Report

Ms. Workman,

As a reporting requirement of our NPDES permit, enclosed, in duplicate, is the Sanitary Sewer Overflow Annual Report for the period covering January 1, 2021 to December 31, 2021.

Please do not hesitate to contact me at (440) 366-2211, extension 5120 if you have any questions or comments.

Sincerely,
THE CITY OF ELYRIA, OHIO

**CITY OF ELYRIA
SANITARY SEWER OVERFLOW
ANNUAL REPORT**

This report is being submitted by the City of Elyria Wastewater Pollution Control (WWPC) Department to fulfill the requirements outlined in the City of Elyria WWPC NPDES permit 3PD00034*MD. The period covered by this report includes January 1, 2021 through December 31, 2021. This report presents required information for those overflows that are not listed in our NPDES permit without waiving the City's defenses and positions regarding the classification of overflows as separate versus combined.

The City of Elyria is responsible for inspecting 30 unlisted overflow locations when the plant reaches a total flow rate of 30 MGD during a wet weather/rain event. The purpose of these inspections is to note whether or not these overflow locations are overflowing to the Black River. *The overflow locations are identified in Table 1.* Note that EPA has reclassified overflows 100, 101, 114, 132, 189 and 190 as CSOs in the reissued NPDES permit that became effective in June 1, 2021.

The WWPC Department performs a variety of tasks to help minimize activation of unlisted overflows. These responsibilities include:

- 1) Maintaining a grease trap inspection program to verify that restaurants, industries, church halls and other social clubs/organizations are maintaining their grease traps and interceptors with a frequency that will prevent grease from entering the sanitary sewer system. Restaurant owners and personnel are educated, as needed, on the importance of preventing grease from entering the sewer and on the maintenance of their grease traps. Any facility that is found to have grease in the effluent of the grease trap or interceptor is issued a Notice of Violation and fined a minimum of \$100.00. Chronic violations result in escalated enforcement by the City of Elyria Water Pollution Control Board.
- 2) Increased cleaning frequencies of the sanitary sewer collection system in the Midway Mall and Chestnut Commons areas. There are numerous restaurants concentrated in this area that discharge to a particular main in the sanitary sewer collection system. The increased cleaning by the City's sewer collection system crew helps to prevent problems and maximizes the capacity of the collection system.
- 3) Frequent cleaning of all siphons in the sanitary sewer collection system by the City's sewer collection system crew. This cleaning ensures that the siphons are flowing efficiently, preventing backups of sewage in these areas.
- 4) Cleaning and televising the sanitary and combined sewers by the City's sewer collection system crews. The combined sewers on the City's South side are cleaned on a more frequent basis due to the accumulation of grit in these sewers. Keeping both the sanitary and combined sewers clean decreases the probability of plugs in these sewers and maximizes the capacity of the sewers, preventing sewage backups and overflows.

- 5) Cleaning and televising the storm sewers by the City's sewer collection system crews while cleaning the sanitary sewers. Keeping the storm sewers open and in good repair reduces the ponding of water on the ground which, in turn, reduces infiltration into the sanitary sewers.
- 6) Following a rotational schedule for cleaning the gratings of catch basins throughout the year by the City's sewer collection system crew. All catch basin tops are cleaned several times in a typical year. The storm pipes from the catch basins are cleaned while cleaning the sanitary and storm sewers in the area.
- 7) Mailing out the Water Environment Federation (WEF) grease disposal brochures in residential areas whenever collection system maintenance crews find high levels of grease in the sanitary and combined sewers.
- 8) Mailing the Water Environment Federation (WEF) brochure titled, "It's a Toilet, Not a Trashcan" to neighborhoods where wipes and other non-flushable items create issues with the sewers or pump stations.
- 9) Frequently providing pollution prevention information to the community via the City web site (www.cityofelyria.org), by handing out a variety of pamphlets during the Elyria Apple Festival, through Lorain County Solid Waste District functions, through local radio station advertisements, and flyers are included with utility bills. Information is also included in the annual consumer confidence report sent to all residents by the city's water pumping plant. This information deals with litter control, the proper disposal of grass clippings and leaves, reasons for not dumping or placing anything into catch basins, and reasons for not disposing of household wastes (cleaners, solvents, paints, oil, baby wipes, cooking grease, diapers, etc.) in sinks and toilets. Many time's residents will call the plant directly to ask questions about proper disposal of these items.

The City of Elyria continues to maintain the current street sweeping program, placing extra emphasis on the combined sewer areas, in order to minimize the amounts of road grit and solids entering the combination and storm sewers during rain events.

In 2021, there were 22 rain events that caused the WWPC Plant to reach a flow rate of at least 30 MGD. During these 22 rain events, 702 unlisted overflow locations were inspected. Wet-weather overflows were observed for 117 inspections (17%). The average maximum WWPC flow rate for these events was 43.14 MGD, and the average duration of elevated WWPC flow for these events was 6 hours. 14 of the 22 rain events resulted in no overflows. There were no dry weather overflows observed in 2021.

See Table 2 for additional overflow event Information.

2021 Water in The Basement Narrative

When water in the basement (WIB) calls are received, the appropriate WWPC personnel are dispatched to evaluate the cause of the problem. If the cause of the problem is in the City's main sewer, a crew is immediately dispatched to jet-clean the line and remove the blockage and restore the proper function of the sewer system. In some cases, the problem may be due to overloading of the sanitary sewer during storms of very high intensity, or a combination of intensity and long duration. In 2021, of the 286 WIB calls received, two were caused by problems in the City sewer mains. There were 70 sewers that were overloaded due to very high intensity rain events.

In 2021, the overwhelming majority of WIB calls received (214 of 286, or 75%) were the homeowner's responsibility. In almost all cases, the cause of the sewage backup was roots or debris in the homeowner's private lateral pipes and footer tiles. There are several older neighborhoods in the City where the majority of the homeowners have large maple and oak trees in the front yards which lead to roots in the homeowner's private lateral pipes and footer tiles. Given the randomness of the other call dates and locations, no other patterns were observed.

Of the WIB calls received 70 of 286 (24%) resulted from overloaded sewers. The cause of the overloaded sewers was due to extremely high intensity rain events.

The intensity of the rain event on August 13, 2021 resulted in 0.59 inches of rain on the North side of Elyria and 3.0 inches of rain in less than two hours on the South side of Elyria.

The intensity of the rain event on August 25, 2021 resulted in 2.30 inches of rain over a short period of time on the North side of Elyria.

The intensity of the rain event on September 22, 2021 resulted in 3.14 inches of rain.

Of the WIB calls received 2 of 286 (1%) resulted from a problem within the city's sewer system.

The WIB call at 120 Riverside Court was caused by the apartment building tenants flushing grease, wipes, and rags that entered the city sewer which does not receive much flow. Upon arrival, the crew jetted the line and removed the blockage and observed grease, rags, and wipes in the line. The CCTV crew confirmed their findings while televising the sanitary line, and also observed these items in the apartment complex cleanout. The landlord was verbally notified of our findings and was going to advise his tenants to not flush these items down their drains. This sanitary line is now on our 6 month maintenance schedule to help prevent this from reoccurring.

The WIB call at 169 Alexander Drive was caused by a high intensity rain event and lift station failure. Upon arrival, the lift station crew discovered a crack in the bubbler line

which was only three months old. They repaired the line and manned the lift station all night to make sure there weren't any other issues. The next day they installed a back-up controller to avoid further issues related with the bubbler system.

See Table 3 for a summary of all publicly owned water in the basement (WIB) occurrences received from residents in 2021.

ID # ^A	Location	Description	Receiving Water ^B	Sewersheds ^D	Eliminated ^C
343	WSI	West Side Interceptor	Black River	West Side	

A. Assign each SSO location a unique identification by numbering them consecutively, beginning with 301.

B. Enter name of receiving water. If an SSO enters a storm sewer, enter "SS to (name of receiving water)". If an SSO does not reach a receiving water, enter "None".

*C. If an SSO has been eliminated, enter the date of elimination (MM/DD/YY).

D. A sewersheds is a specific geographic area, such as a city block or a subdivision, that drains to a common outlet.

North	West	Northwest	Southeast	Downtown	Spring Valley
South	East	Southwest	The Heights	Midway Mall	St. Jude

Use additional pages as needed.

CSO ** Per changes in NPDES permit 3PD00034*MD issued 6/2021, these overflows are now defined as CSO's

A. Enter date as "MM/DD/YY". Enter "Various" to summarize overflows of less than 1,000 gallons from an SSO location.

B. Enter the unique identification assigned in Table 1.

C. Enter name of receiving water. If an SSO enters a storm sewer, enter "SS to (name of receiving water)". If an SSO does not reach a receiving water, enter "None".

D. Enter estimate of volume in MG (millions of gallons). Enter estimate of total volume if summarizing data.

Use additional pages as needed.

A. A sewershed is a specific geographic area, such as a city block or a subdivision, that drains to a common outlet.

B. Enter the total number of water in the basement occurrences reported for the sewershed.

C. Enter all causes that apply.

W = extreme weather E = equipment failure P = power failure R = roots

D = debris in line V = vandalism L = line deterioration G = grease

B = other blockages O = other, provide details

Use additional pages as needed.
